Abstract—This paper proposes a general approach to increase the productivity in day to day work flow of the people who are engaged in monotonous task in the industry. This paper explores various deep learning techniques like convolutional neural network and Wavelet Analysis to extract information from wearable devices such as eSensor and Camera. This paper further explores how to give meaningful feedback using Recurrent Neural Network to maximize worker productivity through out the day. Some feedback like worker schedule, stress level and the method of working is suggested in this paper that would increase the total work flow in the industry.

ter, gyroscope, heat detector, light detector and vibration detector increased the dimension of standard information one could garner or gather[?]. Information of such volume crafted the way for machine learning and A.I to effectively optimize the work flow, industrial production and efficiency.

In this paper we tried to use data collected from wearable device like eSensor and camera to understand the work flow of labours in an environment, while improving labours working efficiency by smart scheduling, work placement and stress detection using Artificial Intelligence.

1. Introduction

Since the invention of wearable devices, more and more wearable devices are being used to solve day to day problems [?]. The future is IOT devices and providing smart solution through it. IOT devices are being applied in home monitoring, health monitoring and improving human experiences intensively[?]. These small devices of broad spectrum are changing the way one interacts forever[?].

Human beings are only able to make decision and optimize their day to day activities using the six sense they possess[?]. IOT devices allowed us to go beyond our six senses, this added dimensionality really changed the way one makes decision. These devices worked as a catalyst to provide more information than what one could collect using their biological senses, these information with the help of machine learning and A.I enabled drastic optimization on every sector that feeds on data. Wearable devices like fit-bit, smart watch are changing the whole scenario of data harvesting and decision making [?]. The world is changing, due to small optimization provided by these IOT devices and A.I. Therefore understanding the application of such devices has opened new doors of research.

Manufacturing industry is no stranger to Iot devices and A.I[?]. Germany was the first to understand the potential of optimizing manufacturing process using IOT devices and Artificial Intelligence[?]. They were able to change the whole scene of manufacturing with the integration of small devices in everyday production. Sensors like accelerome-
